

Certificate security-assessment Archie CRM

In December 2022, Archie CRM was subjected to extensive security-tests by Eurofins Cyber Security on request of Archie Europe. The main question to be answered is whether the application is properly protected against unauthorised use. More specifically, it gives an answer to following questions:

Can only authorised users access the application and its data?

Can such users indeed only access data and functionality they are supposed to have access to?

Tests are carried out using state-of-the-art tools by qualified security-engineers using a “grey-box” test approach. This means Eurofins had full cooperation of Archie Europe including access to multiple user accounts and basic information about the technical working of the application.

Eurofins performed multiple series of tests in order to identify any vulnerabilities within the application. Based on the results of these tests, Eurofins concludes that the IT security level of Archie CRM is currently in line with reasonable expectations for modern day web applications.
